

# **ECG** electrodes heart+

- pediatric and neonatal
- for monitoring and diagnostics
- for Holter and cardiac stress tests
- for "special tasks"

In order to efficiently conduct an ECG test, it is necessary to ensure a continuous signal flow from the skin to the ECG device, which requires:

- good preparation of the patient's skin
- high quality **SORIMEX heart+** ECG electrodes
- appropriate selection of electrodes for the type of test

**SORIMEX heart+** electrodes allow the obtaining of perfect ECG signal quality during standard and specialist ECG tests, and the complete portfolio makes it easier to adjust the electrodes to the individual needs of patients and medical personnel.

The appropriate selection of ECG electrodes depends on the test type, the patients' age and their physical features. The variety of materials and gels used for the production of **SORIMEX heart+** electrodes allows the use of appropriate electrodes for the individual needs of medical personnel and patients.

# Pediatric and neonatal ECG electrodes

heart+ for sensitive skin

### Wireless electrodes

- variety of shapes and sizes for easy adjustment for the youngest patients
- efficient monitoring regardless of the child's spontaneous movement
- hypoallergenic electrodes which do not irritate sensitive skin
- a sensor covered with Ag/AgCl ensures perfect conduction
- a clear and reliable signal thanks to the use of a safe solid gel

### Electrodes with a wire

- a hydrogel created especially for neonatal electrodes
- wet gel, especially valuable in incubators
- the possibility to reposition the electrodes multiple times during everyday care of young patients
- X-ray in the product name means the possibility to conduct
   X-ray tests without removing the electrodes
- no dirt and irritation
- compatible with ECG cables finished with DIN 1.5 mm sockets

polyethylene foam

50 pcs/pouch

2000 pcs/case

# ECG electrodes for Holter and cardiac stress tests

# heart+ specialist diagnostics

- reliable quality of recordings with long-term ECG monitoring and stress test
- powerful adhesive for electrode stability, also when the patient is moving
- enable normal patient activity without any disturbances to recordings thanks to dedicated installation of ECG wires
- flexible foam ensures the patient's comfort during the test

# ECG electrodes for "special tasks"

# heart+ for active people

- for especially active patients during a test
- best for people who sweat excessively or are overweight or underweight
- delicate non-woven fabric allows the skin to breathe freely during a test in challenging conditions
- loose mesh of non-woven fabric perfectly adjusts to the shape of the body
- X-ray in the product name means that it is possible to conduct a X-ray without removing the electrodes

# ECG electrodes for monitoring

heart+ everyday precision

### Disposable electrodes

- foam flexibility maintains the electrode in a stable position, increasing the effectiveness of the test
- the sensor covered with Ag/AgCl ensures perfect conduction
- precise diagnosis is possible due to the reduction of artifacts
- variety of shapes, sizes and gels ensures comfort when adjusting the electrode to the test needs

# ECG electrodes for monitoring

heart+ everyday precision

### Reusable electrodes

- quick and stable application when conducting resting electrocardiogram
- possible use with adults and children
- the large size of the conducting element improves conduction
- installation intended for connection with a Ø 4 mm diameter banana plug, latch or clamp

and adults
